

ASSIGNMENT – 1.1

1. Draw a labeled diagram of a desktop PC, clearly marking the motherboard, CPU, RAM, GPU, and both HDD and SSD storage components.

DESKTOP PC – ALL MAIN COMPONENTS & THEIR POSITION

2.Create a comparison table showing the main differences between HDD and SSD storage in terms of speed, durability, and typical use cases.

Hint: Think about which one is faster, which is more shock-resistant, and where you would usually find each type (laptop, gaming PC, etc.).

Feature	HDD (Hard Disk Drive)	SSD (Solid State Drive)
Speed	Slower speed (80-160 MB/s)	Much faster speed (500 MBs -7000 MBs)
Boot Time	Takes longer to start the computer	Boots the computer much faster
Durability	Less durable due to moving parts	More durable because it has no moving parts
Shock Resistance	Easily damaged by drops or shocks	Highly shock-resistant
Typical Use Cases	Desktop PCs, backup storage	Laptop , gaming PCs, high performance desktop

3. Write a short explanation (2-3 sentences each) describing the role of the CPU, RAM, and GPU in running a game like PUBG or Free Fire on a PC.

CPU- the CPU acts as the “brain” of the PC.

In games like PUBG or Free Fire it constantly processes player inputs, calculates bullet trajectories, and tracks the position of all players on the map.

RAM- RAM serves as temporary storage area.

Loading games file, real time action processing, stopping Lag and crashes.

GPU- Showing Graphics and Visuals, delivering high FPS and Smoothness, Handling Resolutions and Shadow effects,

4. Imagine you want to upgrade your PC to run the latest version of FIFA smoothly. List which hardware components you would consider upgrading and explain why for each.

1. Graphics Card (GPU)

Upgrade to a more powerful graphics card to improve game graphics, increase frame rates (FPS), and allow higher graphics setting without Lag.

2. Processor (CPU)

Upgrade the CPU to process game data faster, reducing stuttering and improving overall performance

3. RAM (Memory)

Increase RAM so the game can run smoothly while allowing other background programs to stay open.

4. Storage (SSD)

Replace a hard drive (HDD) with a solid-state drive (SSD) to reduce loading times and improve system responsiveness.

5. Cooling system

Install better cooling (fans or a CPU cooler) to prevent overheating during long gaming sessions and maintain stable performance.
