

Q-1 Open your own laptop or desktop (or use an online PC hardware simulator if you don't have access to a real system) and identify the GPU model installed. Write down the GPU's brand, model number, and whether it is integrated or dedicated.

GPU Identification (Example)

GPU Brand: NVIDIA

GPU Model Number: GeForce RTX 3060

GPU Type: Dedicated Graphics Card (Discrete GPU)

Alternative Example (Integrated GPU):

- **GPU Brand:** Intel
- **GPU Model Number:** Intel UHD Graphics 630
- **GPU Type:** Integrated Graphics (Built into the CPU)

Note: If you are using your own computer, replace the above information with your actual GPU model found in **Device Manager** → **Display adapters** or by using a PC hardware simulator.

Q-2 Take a clear photo or screenshot of the cooling system (fan, heatsink, or liquid cooling setup) inside your PC or from a PC hardware simulator. Label the main cooling components and briefly describe their function.

Q- 3 Create a comparison table listing at least 3 differences between air cooling and liquid cooling systems for GPUs, including factors like cost, efficiency, and maintenance.

Feature	Air Cooling (GPU)	Liquid Cooling (GPU)
Cost	Less expensive and budget-friendly	More expensive due to additional cooling components
Cooling Efficiency	Good for normal gaming and everyday use	Excellent for high-performance gaming and overclocking
Maintenance	Very low maintenance; only occasional dust cleaning	Requires more maintenance and checking for coolant or leaks
Noise Level	Can become louder under heavy load	Usually quieter because the radiator dissipates heat efficiently
Installation	Easy to install and replace	More complex to install and requires additional space
Best For	Everyday users and most gamers	Enthusiasts, professionals, and extreme gaming/workloads

Q-4 Imagine you are building a gaming PC for streaming IPL matches and playing graphics-heavy games. Choose between air cooling and liquid cooling for your GPU, and justify your choice in 3-4 sentences based on your research.

Choice: Liquid Cooling

I would choose **liquid cooling** for my gaming PC because it provides better cooling performance during long gaming sessions and while streaming IPL matches. It keeps the GPU at lower temperatures, which helps maintain high performance and reduces the risk of overheating. Although it is more expensive and requires more maintenance than air cooling, it is a better choice for graphics-heavy games and continuous streaming.
